PROBLEM STATEMENT

People who need plasma are increasing day by day. People who have diseases like multiple myeloma (type of cancer) or plasmacytoma need constant supply of plasma to sustain their life and there is not enough plasma available for them. It is not that people do not want to donate blood and plasma, but because they have no idea where they can donate and also that people are not aware of the importance of blood and plasma donation. It is important for the people who are excited to donate, but yet are very busy, to be sure where and when they can donate, and therefore we are designing a system which saves the information of the registered donors and notifies about the current donors and help the users to track down the necessary information about the donors at the time of their need.
